Function

- Overload Protector is equipped in Press machine to check hydraulic pressure of cylinder inside the slider.
- If happen overload, the hydraulic pressure of cylinder will be released immediately within 3/1000 seconds.
- When happen overload, in order to protect the press and die, the press will stop working immediately after receiving the signal from limit switch.
- After happen overload, the air will drive hydraulic pump to supply normal working pressure immediately and the press can work normally.
- It has pressure control valve inside of overload protector, which can adjust hydraulic pressure automatically and eliminate the impact of rising pressure (which cause by oil temperature rise) in pressing process.
- May select different types of components and control units base on the different types and specifications of press machines.

功能

- 超負荷保護裝置安裝使用於沖床上，用以檢知滑塊油壓缸內部的超負荷油壓壓力。
- 當超負荷情形發生時，油壓壓力能在千分之三秒內迅速被洩放。
- 當超負荷發生時，微動開關產生電氣訊號，通知沖床緊急停止運轉，以保護沖床和模具。
- 超負荷發生之後，由空氣驅動油壓泵浦，快速補足油壓缸的正常工作壓力，使沖床能立即正常操作。
- 超負荷保護裝置內部具有恆壓控制閥，能自動調節油壓壓力，可消除沖床在沖壓過程中，因油溫上升時，而產生壓力上升所受的影響。
- 可依不同沖床型式、規格，搭配所需零組件及控制單元。

Model selection 型式選用：V 1 2 3 4 - 5 6 7 - 8

1	Control type 控制方式	A : Air type / 氣壓式 S : Spring type / 彈簧式				
2	Suitable for capacity of press 適用沖床噸數	Under 200 tons	06 : Small type / 微小型 08 : Standard type / 標準型 10 : Large flow type / 大流量型			
		200-600 tons	12 : Standard type / 標準型

Selection Basis / 選用依據

Specification & Parameter of Press / 沖床規格參數

F : press rated capacity 沖床能力(tons)
 S : stroke length 滑塊行程(mm)
 N : stroke per minute 每分鐘行程數(SPM)
 H : rated tonnage point 能力發生點(mm)
 D : cylinder diameter 油缸直徑(cm)
 n : cylinder number 油缸個數(pc)
 h : cylinder stroke 油缸之活塞行程(cm)

Calculation Formulas for Model Selection / 型式選用計算流程

$A = (\pi D^2 / 4) \times n$ (cm²) cylinder area 油缸面積
 $P = F \times 110\% \times 1000 / A$ (kgf/cm²) hydraulic pressure setting of overload (VS model) 超負荷設定的油壓壓力
 $P_a = P / m$ (kgf/cm²) air pressure setting of overload (VA model) 超負荷設定的空氣壓力
 $V = N \sqrt{SH - H^2} / 87.5$ (cm/sec) drop speed of slide 滑塊下降速度
 $Q = A \times V$ (cm³/sec) releasing flow rate 超負荷發生時的洩放流量
 $L \geq 4 \times A \times h$ (cm³) volume of oil tank 油箱容量
 • m : ratio of overload hydraulic pressure 超負荷壓力倍數
 • Releasing flow rate (Q) of overload protector, which you choose has to be more than of cylinder volume.
 If releasing flow rate isn't enough, please use two sets of overload protector

Example / 範例 : (model:VA(VS)08-7□□)

F = 160 tons $A = (\pi 26^2 / 4) \times 1 = 531$ (cm²)
 S = 200 mm $P = 160 \times 110\% \times 1000 / 531 \approx 332$ (kgf/cm²)-----VS model
 N = 40 SPM $P_a = 332 / 70 \approx 4.75$ (kgf/cm²)-----VA model
 H = 6 mm $V = 40 \sqrt{200 \times 6 - 6^2} / 87.5 = 15.6$ (cm/sec)
 D = 26 cm $Q = 531 \times 15.6 = 8284$ (cm³/sec)
 n = 1 pc $L \geq 4 \times 531 \times 1 \geq 2120$ (cm³)
 h = 1 cm

Note

- Hydraulic pressure (P) and air pressure (Pa) of overload protector, should be choose as higher as possible.
 (Example : P=335 kgf/cm² or Pa=4.8 kgf/cm²)
- Hydraulic piping size:

VA(VS)08 —□□□—□□□		VA(VS)12 —□□□—□□□	
Size (I.D./O.D.)	Work pressure (maxi.)	Size (I.D./O.D.)	Work pressure (maxi.)
12/18 mm	400 kgf/cm ²	14/22 mm	400 kgf/cm ²
13/18 mm	320 kgf/cm ²	16/22 mm	300 kgf/cm ²
14/18 mm	250 kgf/cm ²	18/22 mm	200 kgf/cm ²

- Inside diameter of air piping must be more than 6 mm.
